There is ample evidence in the literature of the effects of worship, prayer and meditation on the human anatomy, physiology, biochemistry, biophysics, pathology, pharmacology, genetics, psychology [1-3] and on recovery from medical, surgical and psychiatric illnesses [4-8].

The mechanism of action of these effects is mediated through the electromagnetic energy of the human mind [9,10] which in turn is acquired by wireless transmission from the original energy source of Almighty God [11-13] to the human mind as a result of worship, prayer and meditation.

Therefore, there should be subspecialty in all medical disciplines such as Theo-Anatomy, Theo- Physiology, Theo-Pharmacology, Theo-Genetics, Theo-Psychology in basic sciences and Theo- Medicine, Theo-Surgery, Theo-Psychiatry, Theo-Neurology in clinical sciences.

These subspecialties should be introduced in the medical school curriculum because if physicians, in addition to applying their materialistic knowledge of medical science in treating patients, can also apply their spiritual knowledge by praying to God along with the prayer by the patients and/or their families, more patients can be cured.
